

The Premium Fence2Sun

THE FENCE,
THAT PAYS FOR ITSELF

The premium Fence2Sun provides enough electricity to power a single family home while offering a low maintenance and weather resistant alternative to hedges and fences. The bifacial premium Fence2Sun is versatile and can be used for property enclosures, divisions, and separations, as privacy protection – or even as power generator.

Multiple benefits

The Fence2Sun serves as a fence, a power generator, and pays for itself. At the same time, it makes every user more independent from high electricity costs.

Space saving alternative

Due to its vertical design, the Fence2Sun requires significantly less space than a conventional PV system. Therefore it is an excellent alternative or complement to a rooftop system.

Demand orientated power production

The Fence2Sun generates higher yields at a low standing sun, especially during the morning and evening hours, as well as in the less productive winter months when energy demand is high.

Easy installation and maintenance

The Fence2Sun can be adjusted to terrain slopes and is quickly assembled with just a few screw connections. Due to its simple and ground level design, the maintenance effort is very low.

Durability

The use of specially designed glass-glass modules ensures lasting stability and robustness. High quality galvanization with optional powder coating provides maximum corrosion protection. The cables are protected from external influences within enclosed frame profiles.

Above average performance

The combination of a shading optimized frame system and bifacial solar modules with high rear side efficiency enables an output of up to 1200 kWh/kWp per year.
